Research Experience

Short Description of Research Activities

The research activity of Gabriella Pasi is related to the field of **Artificial Intelligence** and addresses various tasks related to the analysis of texts in natural language and to the extraction of knowledge/information from texts. In particular, she has been working at the definition of innovative models and systems that allow an effective and personalized access to information relevant to specific user needs. Since a few years she is also working at the issue of analyzing various aspects of the information (user generated content) produced on social media.

In relation to the issue of accessing information relevant to specific users' needs, the considered categories of systems include Information Retrieval Systems (Search Engines), Information Filtering Systems (recommender Systems), Database Management Systems and Decision Support Systems. The common objective of the research activities undertaken in relation to this issue is defining flexible and intelligent systems, able to manage both precise and imperfect information, i.e. information affected by imprecision/vagueness and/or uncertainty, and to adapt to the user context. The design of such flexible systems has been pursued by investigating the application of "soft computing" techniques (mainly based on fuzzy set theory, possibility theory, and fuzzy multi-criteria decision making) to various tasks concerning both text representation and retrieval. In particular, the use of Possibility Theory has been investigated to define models for the representation of incomplete data and information; Fuzzy Set Theory has been applied to define both flexible query languages, and innovative retrieval models.

Multi Criteria Decision Theory, especially concerning the problem of aggregation, has been applied in both contexts of IR (e.g. for multi-dimensional relevance assessment) and of social media analytics.

She is actually working on various research topics related to the above issues, among which:

- Text mining
- Uncertain Knowledge Representation
- Definition of systems for contextual information access
- User Profiling by means of: language and topic models, semantic networks, deep neural networks.
- Social media analytics
- Recommender Systems
- Analysis of information diffusion on social networks.
- Evaluation of personalised Search

Since 2005 she leads the **Information and Knowledge Representation, Retrieval, and Reasoning (IKR3) Laboratory** (formerly named **Information Retrieval Laboratory**) within the Department of Informatics, Systems and Communication, University of Milano Bicocca. Her research group is actually composed of a Researcher (Marco Viviani), and three PhD students (Divi Praseyo Putri, Elias Bassani, Paolo Tenti).

The IKR3 Lab has been hosting several visiting PhD students and visiting professors. Gabriella Pasi has supervised more than 100 Bachelor and Master Thesis, some of which at the Università della Svizzera Italiana, Lugano, Switzerland (Faculty of Informatics).

Within the Institute of Multimedia Technologies of the National Council of Research (C.N.R.) she was responsible of the research line "Modelling imprecision and uncertainty in systems for information access".
